

Data Exploration and Visualization

Unique Country Values

The `unique()` method is applied to the Country column to list all unique country names. This verifies that each country appears only once in the dataset and helps identify duplicate entries before further analysis.

```
Development["Country"].unique()

array(['Norway', 'Australia', 'Switzerland', 'Germany', 'Denmark',
       'Singapore', 'Netherlands', 'Ireland', 'Iceland', 'Canada',
       'United States', 'Hong Kong, China (SAR)', 'New Zealand', 'Sweden',
       'Liechtenstein', 'United Kingdom', 'Japan', 'Korea (Republic of)',
       'Israel', 'Luxembourg', 'France', 'Belgium', 'Finland', 'Austria',
       'Slovenia', 'Italy', 'Spain', 'Czech Republic', 'Greece',
       'Brunei Darussalam', 'Estonia', 'Andorra', 'Cyprus', 'Malta',
       'Qatar', 'Poland', 'Lithuania', 'Chile', 'Saudi Arabia',
       'Slovakia', 'Portugal', 'United Arab Emirates', 'Hungary',
```

Mean Years of Schooling vs HDI

A strip plot is created to visualize the relationship between Mean Years of Schooling and HDI. The visualization indicates how educational attainment is associated with the Human Development Index.

Life Expectancy vs HDI

A strip plot is generated to examine the relationship between Life Expectancy and HDI. Countries with higher life expectancy generally tend to have higher HDI values.

Correlation Heatmap

A correlation heatmap is generated using Seaborn to measure the relationships between numerical features. Variables with stronger positive correlation with HDI are considered more suitable as input features for machine learning.
